Subject: RE: articoli corfilac

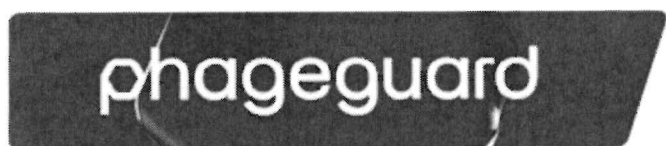

Dear Francesca and Raimondo,
Thank you very much for inquiry. I was under the impression that a protocol would be provided to verify the anticipated activities, and importantly also to verify the quantity of product that would be required for the tests. The anticipated quantity of phages will depend on the minimal quantity you can process in the encapsulation set up and the subsequent lab-scale cheese testing you would like to do.

To make next steps, I propose is that we will ship two 100 ml PGL bottles: one bottle to Sphera (for encapsulation) and one bottle to University of Palermo (for initial testing and protocol optimization). This should suffice for the initial testing. The cost per bottle are EUR 300,= , excluding shipping cost (approximately EUR 50,=, cold shipping). We will most likely be able to ship the materials beginning of next week, and in that way the products should arrive at your locations later that week .

Herewith I would like to ask you to complete the attached Customer form with the right shipping information etc. Please fill out one document for each location.

Trust this will work. Thanks in advance for your input. Best regards, Jeroen

Kind regards,
Jeroen Wouters, PhD

Dear Jeroen,

I wanted to ask if we could have a timeline to understand when we will be able to obtain the sample?

Otherwise, if it is easier and faster, we would like to proceed by buying the product from the Italian provider.

Have a nice day

Dear Jeroen and Barbara,

Please find attached the relevant articles:

- In Fort et al., we found the ref to your product.
- Garcia Anaya (2023) and Vonasek (2014) are the reference taken from literature to create the edible film, As you can see the protocol is very simple and is more about creating the right mixture to obtain the film upon drying.

Let me know if you need further information from our side.

Have a nice day

Francesca
